

VENTLESS ENERGY RECOVERY - TECHNOLOGY TO CAPTURE HEAT & STEAM

Steam from the wash and rinse cycles is condensed out of the air in the wash chamber.

Heat energy from the steam preheats cold inlet water for the booster, reducing the energy to heat it for the sanitizing rinse (180°F).

Condensing steam in the dishwasher reduces latent and sensible heat gain in the dishroom and eliminates the need for a costly vent hood.

Save more than \$5,000 on installation costs*

Ventless Energy Recovery captures heat energy while condensing steam from the wash and rinse cycle to preheat the incoming cold-water for the final rinse cycle.

Lower your HVAC requirements from reduced latent and sensible heat gain to the room, and save more than \$5,000 by eliminating the need for a vent hood.
