HOBART

MODEL 5114 MEAT SAW

Spec. #9060 (60 Cy.)

Spec. #9062 (50 Cy.)

THE HOBART MANUFACTURING COMPANY

The World's Oldest and Largest Manufacturer of Computing Scales
and Food Store, Kitchen, Bakery and Dishwashing Machines

TROY, OHIO, U.S.A.

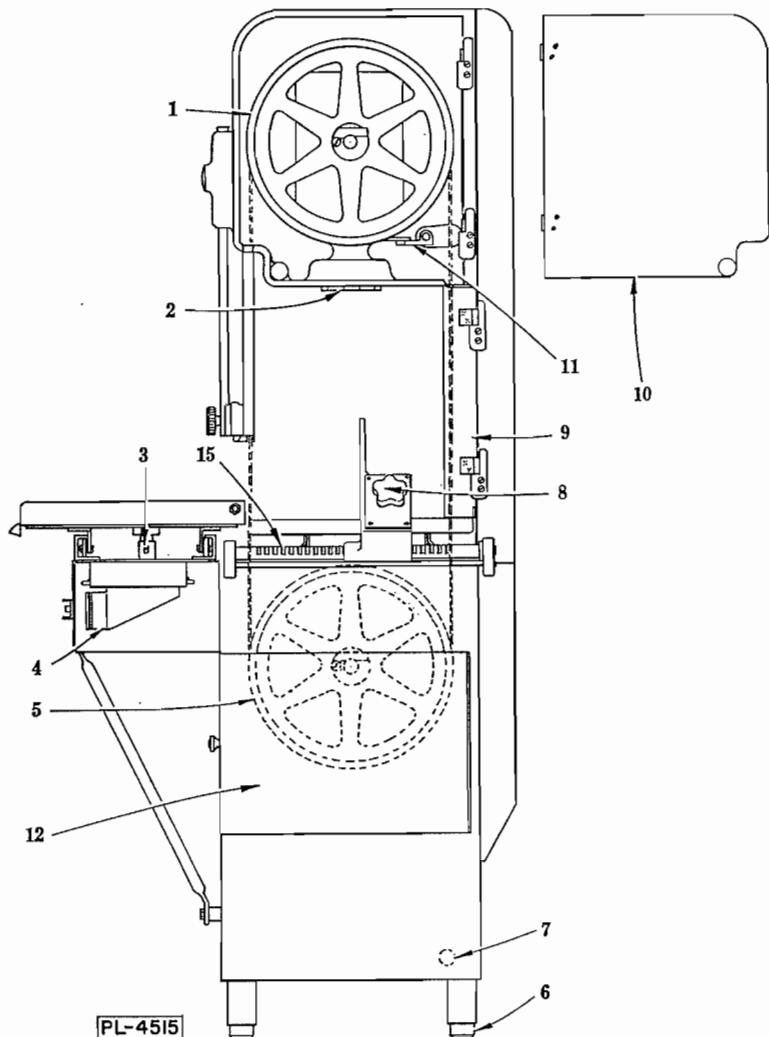

FIG. 1

Installation, Operation and Care of MODEL 5114 MEAT SAW

I. UNPACKING

Remove the shipping box that covers the saw. Next, unpack the following parts that were disassembled for shipping purposes; table assy., carriage assembly, base cover plate assy. (with front & rear tracks), front table rest, rear table rest, and feet. (Instructions for re-assembly of these parts are given in section II, "Setting Up"). Remove the four retaining bolts from the under-side of the skid.

II. SETTING UP

(1) Place the machine in the location where it is to be used. Re-assemble the feet (6, Fig. 1). Place a spirit level on top of the base unit and adjust the feet in the legs so that the base unit is level from side to side and front to back.

(2) Remove the motor access panel on the left side of the machine. Assemble the base cover plate assy. (with tracks) using the two taper pins as locators. Next, assemble the front and rear table rests, using the taper pins as locators.

(3) Lower the upper blade pulley (1, Fig. 1) by giving the tension adjustment hand wheel (2, Fig. 1) a few turns to the left. Open the head door (10, Fig. 1), then unlatch and open the blade cover assy. (9, Fig. 1). Lift the hand knob (8, Fig. 1) and raise the gage plate (1, Fig. 4) to its stopped position. Lift out the lower front wiper unit (Fig. 3) and lower the upper guide unit (Fig. 2) to its lowest position. Place the saw blade over the upper blade pulley (1, Fig. 1) and lower blade pulley (5, Fig. 1). The teeth must point to the right and downward when viewed from the front as shown in Fig. 3. If they do not point downward, remove the blade, twist inside out and replace it on the saw. Make sure the blade is properly centered in the rear blade wiper (8, Fig. 3) and properly placed in the upper guide unit (Fig. 2). Turn the tension adjustment hand wheel (2, Fig. 1) to the right until the figure 3 starts to show in the tension indicator (11, Fig. 4). Give the upper blade pulley a few turns by hand so that the blade centers itself on

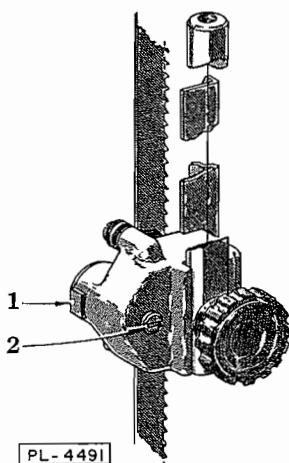

FIG. 2

the pulleys. Then turn the tension adjustment hand wheel slowly to the right until the indicator registers approximately "4" at eye level. This is the best operating tension for the blade.

NOTE: See Paragraph IX for adjustment of blade back-up blocks.

(4) Close the head door (10, Fig. 1) and column cover (9, Fig. 1).

(5) Before assembling the lower front wiper unit (Fig. 3), swing up the bakelite guard (1, Fig. 3) and see that the saw blade is between the two wipers (3, Fig. 3) and in the guide slot of steel block (5, Fig. 3). After sliding the unit into place, close down the bakelite guard (1, Fig. 3).

(6) With the gage plate (1, Fig. 4) in the raised position (clear of the table area), assemble the table (8, Fig. 4). The table is positioned by the locating slots (9, Fig. 3) in the table rest angles of the base. Make sure the reinforcing angles of the table are outside the table rest angles of the base. Lock the table in place by the spring catch (7, Fig. 4).

(7) The carriage may be assembled from either side. When rolling the carriage into place depress the carriage stop (3, Fig. 1). After this stop is released, the carriage will then be retained from rolling off.

III. WIRING

Check the data on the name plate (6, Fig. 4) to make sure that it agrees with your electrical supply before connecting to the power line. Make your installation connection from the power line directly to the switch. To avoid having conduit at the front of the machine, it is recommended that flexible (or rigid) conduit be connected through the electrical inlet hole in the base (7, Fig. 1). The conduit connector on the end of the motor lead conduit should be assembled in the knock-out hole in the switch box. Next, connect the motor leads to the switch.

Be sure to use wire large enough to meet your local code requirements. For proper performance

use wire sizes of NOT LESS than #10 gage for 115 V., or #14 gage for 230 V. on single phase models. Use #14 gage for 208, 220, and 440 V. on three phase models. For long runs, between power inlet and saw, use a larger size.

IV. SAFETY FEATURES

The Hobart saw is provided with safety devices to give maximum protection to the operator. Keep the guards in place at all times.

(1) **UPPER GUIDE ASSEMBLY** (Fig. 2): Keep as low as the size of the work permits.

(2) **DOORS:** Keep all doors closed while the machine is running.

(3) **BUTT-END PUSHER** (4, Fig. 4): Use the pusher plate as described in section VI and it will be unnecessary to hold your hand near the running saw blade.

(4) **GAGE PLATE:** The end of the gage plate (1, Fig. 4) is shaped to give maximum support and protection at this critical point, and at the same time, facilitate the taking off of slices.

V. LUBRICATION

Very little lubrication is required, because all the high-speed shafts have either roller or ball bearings which are grease packed and will operate a long time without attention.

(1) Keep a small amount of grease in the six ball bearing rollers on the carriage.

(2) Apply a few drops of oil frequently to the gage plate rack (5, Fig. 4) and work the gage plate assembly back and forth a few times. (See cleaning instructions).

(3) For top operating efficiency have your local Hobart service man check this machine at least once a year.

VI. OPERATION

Place the item to be cut on the carriage and turn on the motor switch. Stand in front of the machine, leaning lightly against the scalloped front of the carriage and move the carriage to the left, past the saw blade, at a steady and uniform rate. Your left hand will then be free to take away and stack the items as they are cut off. Make it a habit to move your hand around the left side, or back of the saw blade, when reaching for an item—NEVER IN FRONT OF THE TEETH. On the return stroke, pull the item toward you so that it clears the saw blade.

An optional carriage lock is available (when ordered) to lock the carriage in a fixed position. With this locked carriage, the same safety procedure of reaching to the left side or back of the saw blade when removing or stacking items should ALWAYS be observed.

When cutting slices of uniform thickness, set the gage plate at the desired point with adjusting

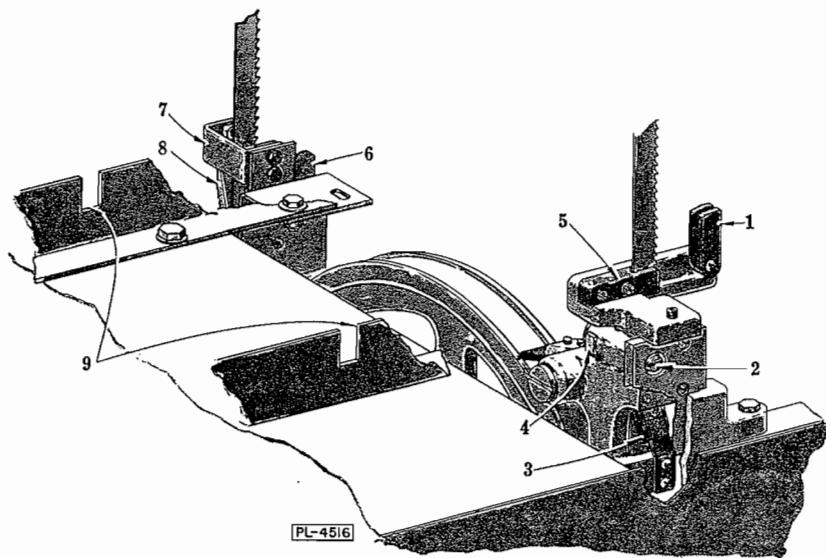

FIG. 3

knob (2, Fig. 4) on the scale etched on the table. If the gage plate is not needed and interferes with the work, it may be raised out of the way. Lift the release knob (2, Fig. 4) and slide the gage plate on back to the end of gage plate rack (5, Fig. 4). The gage plate may be swung to a raised position at any setting along the gage plate rack without lifting the release knob.

To slice short ends, use the pusher plate (4, Fig. 4) to hold the meat against the gage plate. A groove of the pusher plate slips over and slides along the formed edge of the carriage. By holding the pusher plate with your right hand, your hand will then always be a safe distance from the saw blade and the stop will prevent the pusher plate from going too far. When not using the pusher plate, keep it stored beneath the carriage track, where provision has been made for holding it (4, Fig. 1).

VII. CLEANING

It is very important that any machine used in preparation of food be kept in a clean and sanitary condition. This saw has been designed to make cleaning a quick and easy job.

Daily cleaning is recommended.

SUGGESTED CLEANING PROCEDURE:

(1) Roll carriage to extreme right or left. This exposes the carriage stop. Depress carriage stop and roll off stainless carriage.

(2) Rotate gage plate to raised position.

(3) Release table clamp and remove stainless steel table.

(4) Clean the gage plate rack (15, Fig. 1) making sure that there is no "build-up" of mate-

rial in the notches of the rack. This is IMPOR-TANT.

(5) Loosen the hand knob (10, Fig. 4), bump with hand to loosen stud and then remove the hand knob. Open head door (10, Fig. 1). Lift out upper pulley wiper (11, Fig. 1). Clean unit and lubricate with TASTELESS oil.

(6) Swing lower saw bakelite guard (1, Fig. 3) up and lift out lower wiper assemby. Clean unit thoroughly and lubricate with TASTELESS oil.

(7) Press spring catch (6, Fig. 3) to release, then remove rear wiper sub-assy. (7, Fig. 3). Clean unit.

(8) Open base door (12, Fig. 1) and remove scrap pan.

(9) Release blade tension by turning tension adjustment hand wheel (2, Fig. 1) to the left. Open head door, unlatch and open the blade cover assy. Remove saw blade.

(10) To remove the upper guide unit, remove the hand knob (3, Fig. 4) (blade tension already released) then lift off unit. Clean, lubricate with TASTELESS oil and replace.

(11) The upper and lower blade pulleys may be removed from their shafts by swinging the retaining latches clear of the shafts, then sliding the pulley from the shaft. Clean pulleys and lubricate bore before replacing.

(12) Special designed hinges allow the head door (10, Fig. 1), the blade cover assembly (9, Fig. 1) and the base door (12, Fig. 1) to be lifted clear of the machine for thorough cleaning.

All areas are now exposed for easy and thorough cleaning.

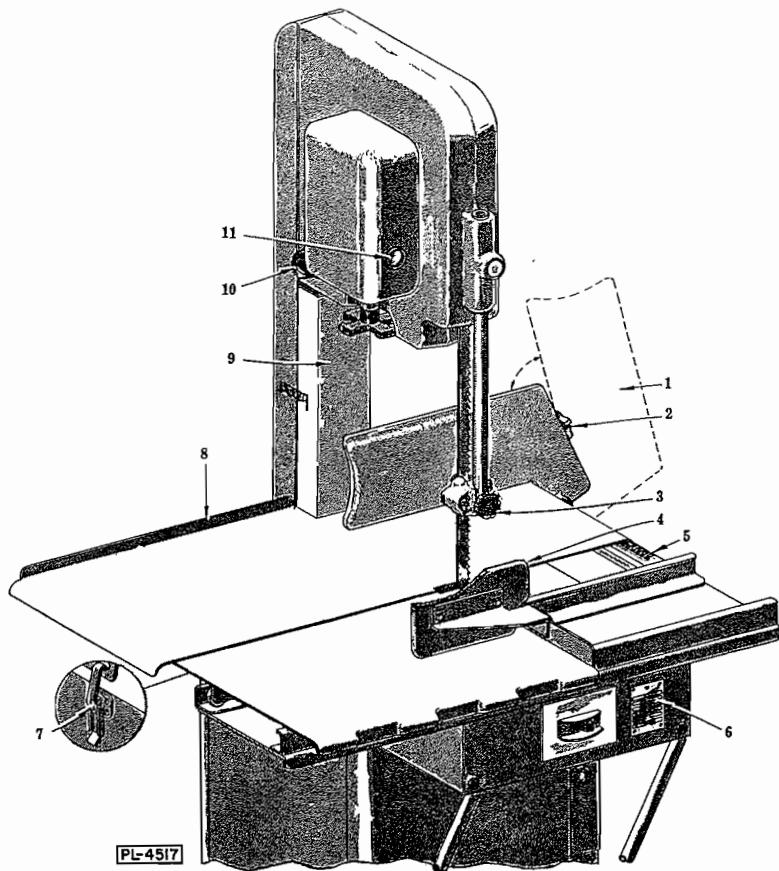

FIG. 4

NOTE: When replacing pulleys, make sure that pulley latches are properly seated in grooves of shaft. (Upper and lower blade pulleys are interchangeable). Also the blade and pulley wipers must be in proper operating positions.

VIII. CHANGING SAW BLADES

This meat saw is so designed that the saw blade may be quickly and easily replaced. Use the following method for replacement:

- (1) Move the carriage to the left to the stop, then depress the stop and move the carriage a few more inches just beyond the bakelite guard.
- (2) Rotate gage plate to raised position.
- (3) Lower upper blade pulley by turning tension adjustment hand wheel to left.
- (4) Release table clamp (7, Fig. 4) and lift off the table (8, Fig. 4).
- (5) Open head door, unlatch and open blade cover assembly.
- (6) Swing up lower bakelite guard (1, Fig. 3) and remove blade.

- (7) Put on the new blade, turn the tension adjustment hand wheel to the right until the edge of the "3" first appears in window (11,

Fig. 4). Turn the upper blade pulley (1, Fig. 1) by hand to center the blade. Then turn the tension adjustment hand wheel until the indicator (11, Fig. 4) registers "4" at eye level. Close lower bakelite guard (1, Fig. 3). Make sure that front and rear lower blade wipers are on both sides of the blade.

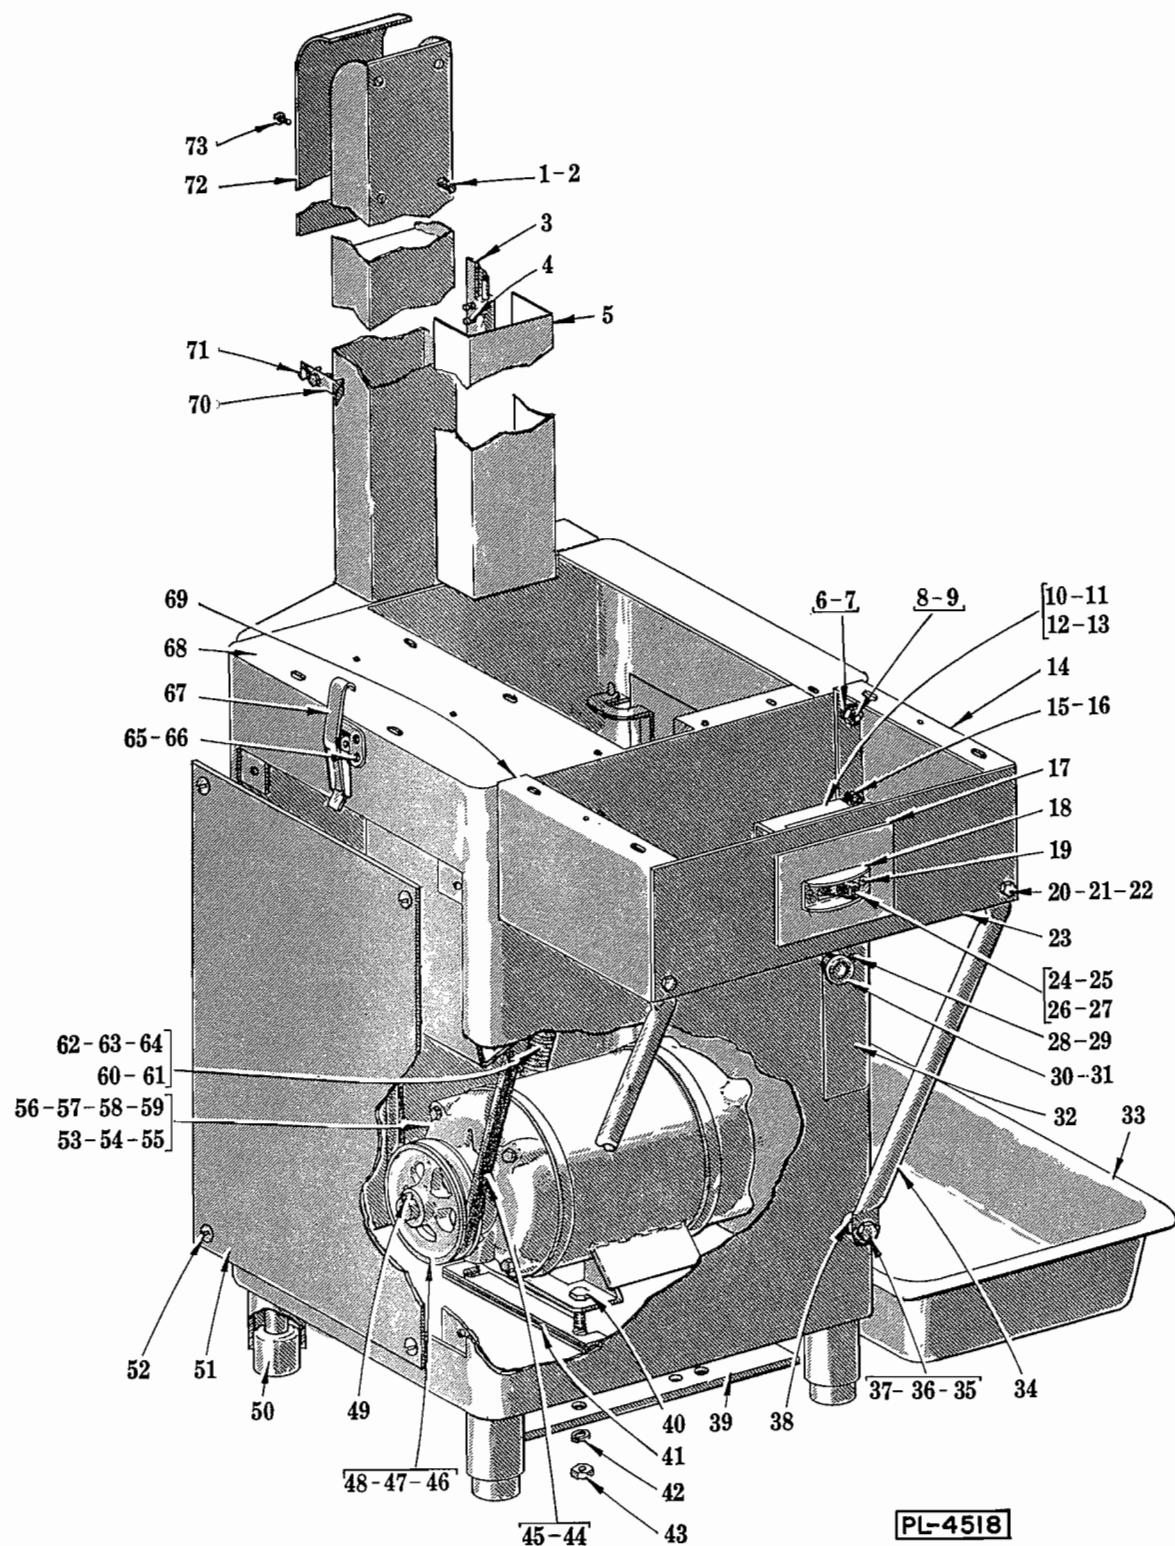

IX. ADJUSTMENT OF BLADE BACK-UP BLOCK

At the back edge of the saw blade in the upper guide (1, Fig. 2) and the front lower wiper unit (4, Fig. 3) are special tungsten carbide blade back-up blocks (eliminating the old fashioned ball bearing back-up). These special blocks take the cutting thrust. The clearance between these blocks and the blade, with the saw running without load, should be approximately $1/32''$. Always check this dimension after changing blades. These back-up blocks should be adjusted to suit any variation in blade widths.

NOTE: Adjust the upper back-up block (1, Fig. 2) by turning screw (2, Fig. 2) and lower back-up block (4, Fig. 3) by turning the screw (2, Fig. 3).

X. BLADE REPLACEMENT

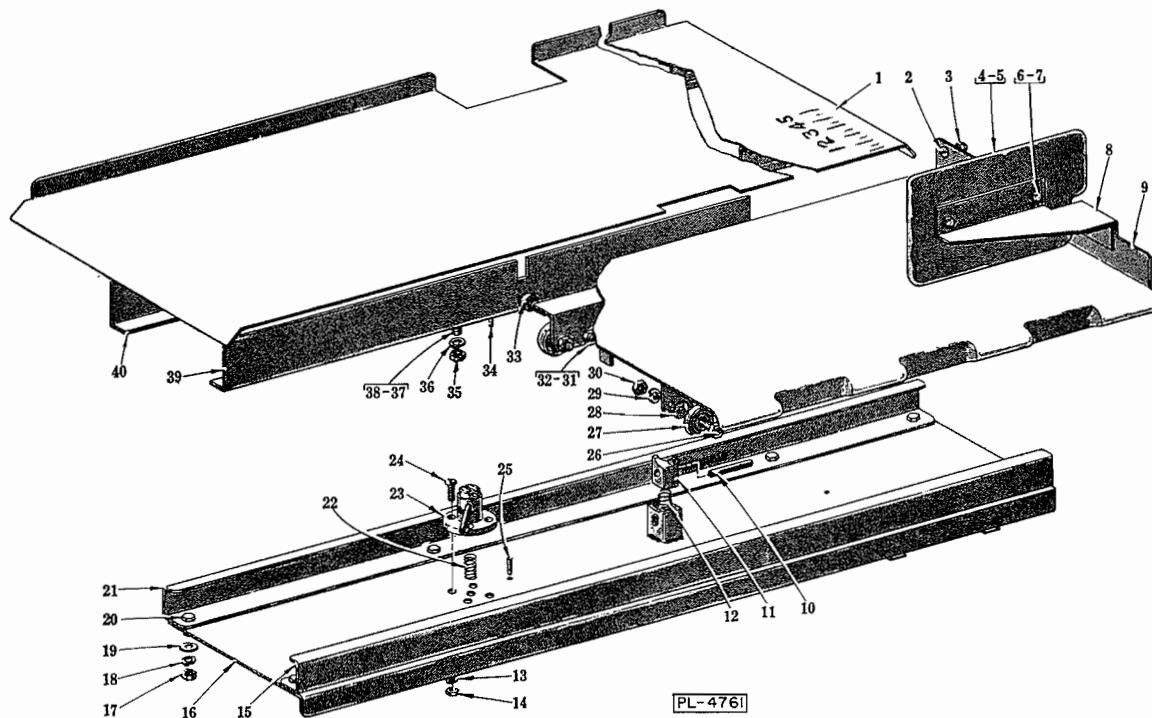

Two saw blades are furnished as regular equipment with every machine. Replacement blades are available thru all Hobart offices.
